

Google Ads API — Tool Design Document

2KO Group · Basic Access Application · 28 August 2026

Applicant	2KO Group (trading as 2KO Systems), South Africa
Manager account (MCC)	434-363-4049
Managed accounts	2KO Africa (351-600-6867); Impart Agency (672-553-2284)
Website	https://2kosystems.com
API contact	darren@2kosystems.com
Company type	Agency / SEM
Tool access	Internal users only — employees and contractors of 2KO Group
Access requested	Basic Access

1. Business model

2KO Group is a South African firm with two lines of business. The first is vocational and professional training, advertised through the 2KO Africa Google Ads account, which we own and operate. The second is 2KO Systems, which builds fixed-price operational software for South African businesses and, as an agency, manages Google Ads accounts for a small number of client businesses.

Our commercial offer to clients is a fixed-fee engagement. We publish our prices on our website. We do not resell advertising inventory, we do not take a percentage of ad spend, and we do not operate an advertising platform or marketplace.

Every account we touch is either an account we own, or a client account to which the owner has explicitly granted us manager access through the standard Google Ads account-linking flow. We do not access any account without that link in place.

2. The tool

The tool is an internal command-line and web application used by 2KO staff. It has two functions, described below. It is not distributed, licensed, resold or exposed to anyone outside 2KO Group.

2.1 Account hygiene and reporting

Scheduled and on-demand pulls of campaign, ad group, keyword, search term and conversion-action data across the accounts we manage. Staff use the output to maintain negative keyword lists, monitor bid strategy configuration, confirm that conversion tracking is installed and reporting, and produce internal performance summaries.

The tool applies changes in two areas only: adding campaign-level negative keywords, and adding or pausing keywords. Every mutation is reviewed by a member of staff before it is applied. There is no unattended or automated bidding, budget or creative modification.

2.2 Diagnostic audit

A rule-based audit that reads an account and produces a written report for the account owner. It scores the account against a fixed rule set of thirty-seven checks across seven categories — measurement, bidding, targeting, structure, geography, landing pages and budget — and reports where spend is going to traffic

that cannot convert, and where configuration is working against the advertiser.

The audit is read-only. It makes no API mutations. Its output is a document delivered to the account owner. The rule set is fixed and published, so that any finding can be traced to a stated rule rather than to an opinion.

The audit is run by 2KO staff against accounts we manage, or against a prospective client's account after that client has granted our manager account access. The client receives a document. The client does not receive a login, a dashboard, or any other interface to the tool.

3. Intended audience and access

Internal users only. The tool is operated by 2KO Group employees and contractors working under 2KO Group. No external party — including clients whose accounts are audited — is given access to the tool, its interface, its credentials, or raw Google Ads API data.

Party	What they can do	What they receive
2KO staff	Operate the tool; review and approve mutations	Full tool access
Client / account owner	Grant or revoke manager access at any time	A written report only
General public	Nothing	Nothing

Under Google's Required Minimum Functionality policy this is an internal-only tool: used by an agency to manage accounts belonging to itself and its clients, with no external-facing platform. We understand that this classification carries an obligation. Should we ever provide clients direct access to a reporting interface, the tool would become a reporting-only tool, and we would implement the Reporting RMF field requirements before doing so.

4. Architecture and data flow

Stage	Description
Fetch	Authenticated GAQL queries against linked accounts via the manager account. OAuth2 refresh token held server-side.
Normalise	API rows are mapped to an internal row shape shared with our CSV-import path, so the same rule engine runs on our data.
Rule engine	Thirty-seven deterministic checks. Each declares the data it requires and reports 'not assessed' rather than guessing.
Report	Findings ranked by spend at risk, a weighted score, and a fixed dependency-ordered remediation sequence.
Mutations	Negative keyword and keyword operations only, queued for staff review and applied individually. No automated bidding.

4.1 API services used

Service / resource	Operation	Purpose
GoogleAdsService.Search	Read	Campaign, ad group, keyword, search term, geographic and conversion-action reporting
CustomerService	Read	Enumerate accessible customers under the manager account
ConversionActionService	Read	Detect missing or inactive conversion tracking
CampaignCriterionService	Read / Mutate	Read and add campaign-level negative keywords
AdGroupCriterionService	Read / Mutate	Read keywords; add or pause keywords

Estimated volume: well under 1,000 operations per day. A full audit of one account is a few hundred read operations. We expect to operate a small number of accounts.

5. Rule set summary

The audit's checks and their weightings. Each check is either derivable from the API with no human judgement, or is explicitly marked as requiring manual inspection.

Category	Weight	Representative checks
Measurement	30%	No conversion action configured; spend with zero recorded conversions; no primary action; proxy conversion
Bidding	20%	Smart bidding active with fewer than fifteen conversions in thirty days; target CPA never met; uncapped M
Targeting	20%	Negative list absent; match-type imbalance; spend on search terms unrelated to what the advertiser sells
Structure	10%	Performance Max running without a conversion signal; network bleed; missing ad rotation and extensions
Geography	10%	Presence-or-interest location targeting; spend outside the serviceable area
Landing pages	5%	Dead final URLs; insecure (http) landing pages; message mismatch
Budget	5%	Budget-limited campaigns; spend concentrated in campaigns with no return

5.1 Reporting integrity

The report separates what is proven from what is inferred. Spend is classified as confirmed waste only where a specific search term, location or dead URL can be shown to the advertiser. Spend that cannot be evaluated — for example, an account with no conversion tracking installed — is reported as unmeasured, not as waste. Where Google withholds low-volume search terms, the report states the proportion withheld and declines to extrapolate into its headline figure.

6. Policy compliance

Requirement	How we comply
Account access	Only accounts we own, or client accounts linked to our manager account by the owner, who may revoke at any
Data handling	API data is used solely to operate the accounts it came from and to report to that account's owner. It is never ag
Credential security	Developer token and OAuth credentials are held as environment secrets, excluded from source control, and are
Attribution	Reports state that figures originate from the Google Ads API and identify the date range and account.
No third-party tool	The tool is built in-house. We do not use our token with software developed by anyone else.
Rate limits	Requests are batched and cached; expected usage is far below the Basic Access limit of 15,000 operations per
